

# Stages Built Into NetRexx Pipelines 4.05 & CMS Pipelines V7R1 and Their Differences

## How to Read Syntax Diagrams

Special diagrams (often called railroad tracks) are used to show the syntax of external interfaces.

To read a syntax diagram, follow the path of the line. Read from left to right and top to bottom.

- The ►►--- symbol indicates the beginning of the syntax diagram.
- The ---► symbol, at the end of a line, indicates that the syntax diagram is continued on the next line.
- The ►--- symbol, at the beginning of a line, indicates that the syntax diagram is continued from the previous line.
- The ---►◄ symbol indicates the end of the syntax diagram.

Within the syntax diagram, items on the line are required, items below the line are optional, and items above the line are defaults.

## Pipelines Builtin Stages

Show Stages Implemented in: <input checked="" type="checkbox"/> NetRexx Pipelines: <input checked="" type="checkbox"/> CMS Pipelines:
Show All Details: <input checked="" type="checkbox"/> (Double click on a row to turn it on/off.)

64decode  
decode64  
3.11

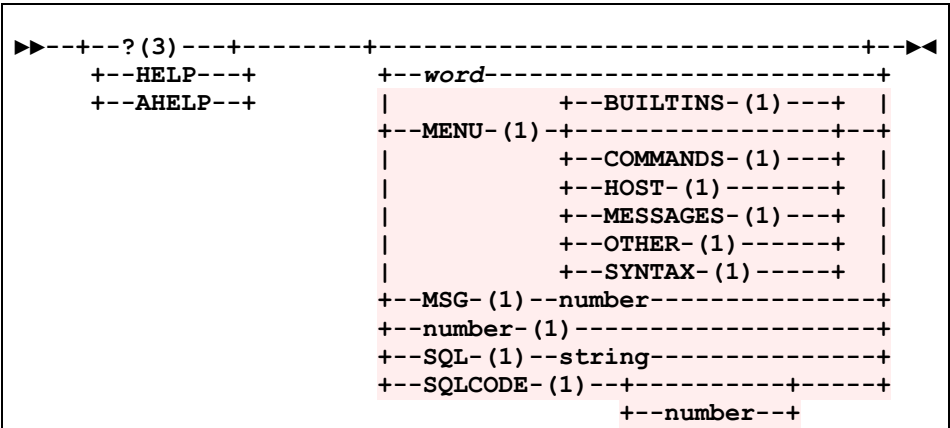

Decode Base-64 Format

- NOTE: CMS is only 64DECODE, and does not have the options; it does MIME.
- BASIC - Output is mapped to a set of characters lying in A-Za-z0-9+/. The encoder does not add any line feed in output, and the decoder rejects any character other than A-Za-z0-9+/.
- URL - Output is mapped to set of characters lying in A-Za-z0-9+\_. Output is URL and filename safe.
- MIME - Output is mapped to MIME friendly format. Output is represented in lines of no more than 76 characters each, and uses a carriage return '\r' followed by a linefeed '\n' as the line separator. No line separator is present to the end of the encoded output.
- 3.11: New to NetRexx. Add MIME, BASIC, & URL options.

?  
ahelp  
help

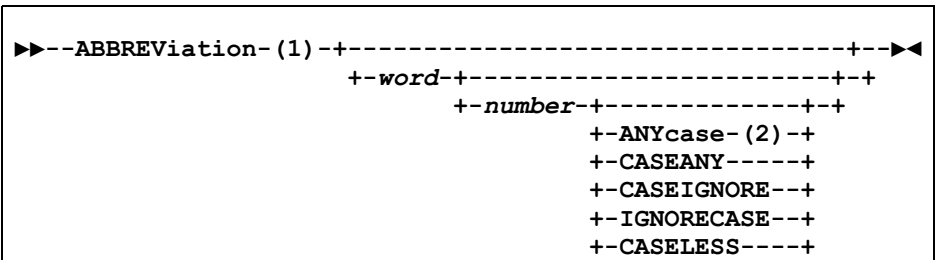

Display Help for Pipelines

- (1) CMS Pipelines only. Not yet in NetRexx Pielines.
- (2) If primary output is connected, lines are propagated, otherwise they are sent to the console by "say."
- (3) ? is the default pipeEnd character. Here it is useful only when a different pipeEnd is defined.

Select Lines Containing Strings (or Not)

Notes:

- (1) "expression" consists of one or more delimited strings separated by logical ANDs, ORs, and NOTs, and grouped, if needed, by parentheses.
- (2) "&" is used for AND.
- (3) Since "|" is the default stage separator, "!" may be used for OR.
- (4) Since NetRexx uses "(" and ")" for options -- which are not used in the ALL stage -- "[" and "]" must be used for parentheses.
- (5) CMS Pipelines, having originated on 3270 terminals, uses "~" for NOT. This symbol is not readily typed on terminals running NetRexx Pipelines, so as alternatives, "\", used by NetRexx, (it needs to be doubled to "escape" it) or "^", used by KEX, NOT symbols may be used as alternatives.
- (6) %debug (must be lowercase) NetRexx Pipelines writes the logic line to the file ALL.DEBUG in the current directory. Windows may make it all.debug . CMS Pipelines writes the constructed pipeline (of LOCATE and NLOCATE stages) to ALL DEBUG A.
- (7) %dump (must be lowercase) - writes to the primary output stream as the first record. NetRexx Pipelines writes the logic line. CMS Pipelines writes constructed pipeline.
- (8) %see (must be lowercase) - NetRexx Pipelines Only. Writes the logic line to the standard output (terminal).
- CMS Pipelines uses its own logic order. NetRexx Pipelines uses regular NetRexx logic.

Examples:

```
• literal NetRexx is Good,NetRexx is Great,NetRexx is Fantastic |
  split , |
  all /a/ |
  cons

  ▶NetRexx is Great
  ▶NetRexx is Fantastic

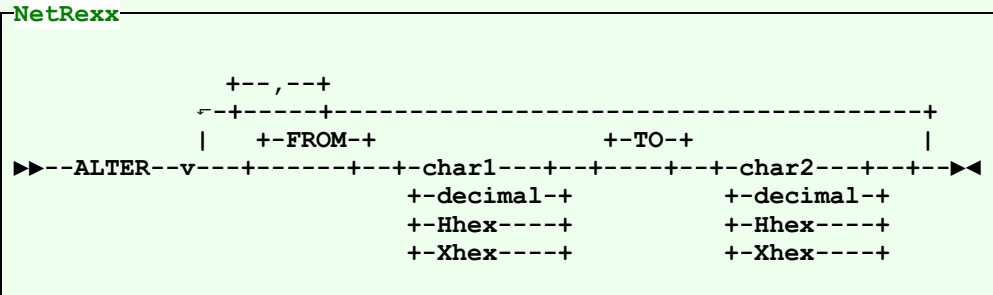

• literal NetRexx is Good,NetRexx is Great,NetRexx is Fantastic |
  split , |
  all / G/ & [/oo/ ! /F/] |
  cons

  ▶NetRexx is Good

• literal NetRexx is Good,NetRexx is Great,NetRexx is Fantastic |
  split , |
  all /R/ & [/oo/ ! /F/] |
  cons

  ▶NetRexx is Good
  ▶NetRexx is Fantastic
```

Change the contents of records, from one character to another

- An variation on the theme of Xedit's ALTER.
- There are pairs of char1s and char2s, optionally separated by commas.
- For each pair of char1 and char2, this changes ALL char1s to char2, like Xedit's 4th and 5th parameters were 1 and 1.
- The chars can be single characters, 2 or 3 digit decimal numerical representations, or beginning with H, h, X, or x hexadecimal representations.
- Also see [TRANSLATE](#) / [XLATE](#).
- Not in CMS Pipelines.

  |
  | +-FOR- (1)+          |
  +-+-----+--numorstar+

changeString:
|--delimiter--string--delimiter--string--delimiter--|

anycase:
  +-RESPECTCASE- (1)+
  |--+-----+--|
  +-ANYcase-----+
  +-CASEANY-----+
  +-CASEIGNORE-----+
  +-IGNORECASE-----+
  +-CASSLESS-----+
```

- (1) NetRexx Pipelines only.

changeparse  
changepars  
changepar  
changepa  
changep  
3.11

Change the contents of records, using Rexx Parse. Calculations can be done.

```
NetRexx
      +-FROM+          +-TO+
►--CHANGEParse--+-----+parse_template_Dstring+-----+output_template_Dstring--►
  |
  | +-BY-by_NetRexx_Dstring+
  |
  | +-FIRST-first_NetRexx Dstring+ +-FINALLY-finally template Dstring+
  |
```

- Records are parsed via the parse\_template\_delimited\_string.
- Variables are named \$n, where n is 1 to 9.
- The by\_NetRexx\_delimited\_string is interpreted. This is 0 or more semicolon separated NetRexx statements, probably using the \$n variables, which can have the value altered.
- Other variables may be used, and are persistent while the stage is active, so can be used as accumulators.
- The values of the variables are put into the output\_template\_delimited\_string replacing \$n.
- For a literal \$n that won't be changed, use \$\$n.
- A first\_NetRexx\_delimited\_string, if present, is interpreted before reading any record from the primary input steam. This is 0 or more semicolon separated NetRexx statements, probably using the \$n variables. Any variables used in the by\_NetRexx\_delimited\_string must be defined here.
- A finally\_template\_delimited\_string, if present, is written as a final output record after the primary input stream is finished, using the \$n's.
- Any keyword phrases must, in any order, follow any non-keyworded FROM & TO phrases.
- This is NetRexx Pipelines only, not in CMS.

Examples:

- changeparse / 2 \$1 +1/ /The second letter is "\$1". \$\$1 won't be changed./
- changeparse from / 2 \$1 +1/ to /The second letter is "\$1". \$\$1 won't be changed./
- changeparse from / . \$2 . 50 \$5 +5 / to /The product is \$1/ by /\$1 = \$2 \* \$5/
- changeparse from / . \$2 . 50 \$5 +5 / ,  
to /The product is \$1/ ,  
by /\$1 = \$2 \* \$5;\$3 = \$3 + \$1/ ,  
first /\$3 = 0/ ,  
finally /\$3 is the total/

<p><i>cms</i></p>	<h3>Issue CMS Commands, Write Response to Pipeline</h3>

collate  
3.11

Collate Streams

```

                                +-NOPAD-----+
▶▶--COLLATE--+-----+-----+-----+-----▶
                +-STOP ANYOF--+ +-PAD-xorc--+ +-| anycase |--+

                                +-MASTER DETAIL----+
▶--+-----+-----+-----+-----▶
    +-inputRange--+-----+    +-MASTER-----+
        +-inputRange--+    +-DETAIL--+-----+
                                +-MASTER--+

▶--+-----+-----+-----▶◀◀
    +-SEPARATOR-delimitedString- (1) (2) -+

anycase:
    +-RESPECTCASE- (1) +
| -+-----+-----+ |
    +-ANYcase-----+
    +-CASEANY-----+
    +-CASEIGNORE-----+
    +-IGNORECASE-----+
    +-CASSLESS-----+
```

- Not implemented in Netrex Pipelines.
- (1) NetRexx Pipelines only.
- (2) delimitedString record is put before each Master Record (or after if DETAIL MASTER order) on the primary output stream.
- 3.11 New to NetRexx Pipelines. Add SEPARATOR option.

combine

Combine Data from a Run of Records

```

▶▶--COMBINE--+-----+-----+-----+-----▶◀◀
    | +-1-----+ | +-aNd-----+
    +-+-----+ | +-AND-----+
    | +-number-----+ | +-eXclusiveor--+
    | +-*-----+ | +-EXclusiveor--+
    | +-KEYLENgth--number--+ | +-FIRST- (2) ---+
    |           +-ALLEOF- (1) + | +-LAST- (2) ----+
    +-STOP- (1) -+ +-+
                +-ANYEOF- (1) +
```

- (1) Only for use with secondary input streams. Only options from this column usable with any secondary input streams. (This is poorly documented in CMS Pipelines. This is a best guess of their intentions.)
- (2) Not usable with STOP and secondary streams.

command  
cmd

Issue OS Commands, Write Response to Pipeline

```

▶▶--+COMMAND--+-----+-----▶◀◀
    +-CMD-----+ +-string--+
```

- input stream 0 is for commands
- input stream 1 is stdin
- output stream 0 is stdout
- output stream 1 is the return code
- output stream 2 is stderr

REXX_DATE_W	wwwwwwww (output only)

- (1): SPACE is optional here.
- (2) Not implemented in NetRexx Pipelines at this time; mainly mainframe useful only.
- (3): NetRexx Pipelines uses IRange which gives a superset of range options.
- (4): NetRexx Pipelines only. What time to assume if blank time on input.
- (5): NetRexx Pipelines only.
  - Use current local date time.
  - Any Inputrange is ignored.
  - Any output format can be used.
  - PREFACE Write the date record before passing the input to the output.

- APPEND Write the output record after passing the input to the output.
- Bad date records out on secondary. Or error if not connected.

*deal*

#### NetRexx Pipelines is more forgiving on input format: Pass Input Records to Output Streams Round Robin

- LONG, SHORT, and normal can all read either 2- or 4-digit years and process per the format;
- leading zeros/blanks can be ignored except where there is no punctuation.

```

+-STOP--ALLEOF-----+
▶▶--DEAL--+-----+-----▶
|          +-ANYEOF----+          |
|          +-number----+          |
+-SECONDARY--+-----+-----+
|          +-RELEASE----+          |
|          +-LATCH- (1) -+          |
+-KEY--inputRange--+-----+-----+
|          +-STRIP-+          |
+-STREAMid--inputRange--+-----+-----+
|          +-STRIP-+          |

```

- (1) Not yet in NetRexx Pipelines
- (2) Not CMS
- Since Java dispatches the stage threads, DEAL may not see a sever immediately, as the severing thread can get multitasked. This can make options like 'ANYEOF' work in unexpected ways.

*deblock*

#### Deblock External Data Formats

```

+-80-----+
+-FIXED--+number--+-----+-----+
|          +-PAD--xorC--+ (1)          |
▶▶--DEBLOCK--+-----+-----▶
|          +-C-----+-----+-----+
|          +-J-----+-----+-----+
|          +-CRLF-----+-----+
|          +-LINEND xorC-----+
+-STRING--delimitedString-+

```

- CMS has many more mainframe centric formats that NetRexx Pipelines does not process.
- (1) Not CMS Pipelines

*decode64*  
*64decode*  
*3.11*

#### Decode Base-64 Format

```

+-MIME--+
▶▶--+DECODE64--+-----+-----▶
|          +-64DECODE--+          |
|          +-BASIC--+          |
|          +-URL--+          |

```

- NOTE: CMS is only 64DECODE, and does not have the options; it does MIME.
- BASIC - Output is mapped to a set of characters lying in A-Za-z0-9+/. The encoder does not add any line feed in output, and the decoder rejects any character other than A-Za-z0-9+/>
- URL - Output is mapped to set of characters lying in A-Za-z0-9+\_. Output is URL and filename safe.
- MIME - Output is mapped to MIME friendly format. Output is represented in lines of no more than 76 characters each, and uses a carriage return 'r' followed by a linefeed 'n' as the line separator. No line separator is present to the end of the encoded output.
- 3.11: New to NetRexx. Add MIME, BASIC, & URL options.

<b>delay</b> 4.05	<b>Suspend Stream</b> <div> <pre> ▶--DELAY--+-----+-----▶          +--+--+       +--+-----+--+numberHr:numberMin:numberSec+--+-----+--+ (1)                                 +--+numberMin:numberSec-----+ +--+ONCE-(2)-+ (1)                                 +--+numberSec-----+ (1) </pre> </div> <ul style="list-style-type: none"> <li>(1) Arguments are NetRexx Pipelines only, not CMS. CMS (and NetRexx when there is no argument) reads delays as the first word of each record. When arguments are present, they follow the CMS conventions for the delay time in records. The + indicates a duration, no + means time of day. The objects do NOT have the delay as the first word. Clock hours are 24h, so 2pm is 14, and are for the next 24 hours if before "now." Seconds can have decimal point and milliseconds. In relative times, the number of seconds and minutes are not limited to 60; so 120 seconds is the same as 2 minutes.</li> <li>(2) Used only for "relative time." EACH, the default, delays before each object; ONCE delays only the first object.</li> <li>Uses Java's Thread.sleep() method and may not be exact in fractional seconds.</li> </ul>

htmlrows  
htmlrow  
3.11

Convert rows to HTML format

- HTMLROWS reads rows from its primary input stream and writes them to its primary output stream, altering them to have the proper HTML tags for TABLE ROWS.
- I.e., it converts  
abc,mnop,xyz  
into  
<tr><td>abc</td><td>mnop</td><td>xyz</td></tr>
- The SEPARATOR QString, by default the comma character, can be specified.
- There are options to put additional data inside the tags. This could be used for class or style tag options, for example.
  - ROW QString : puts its information into the <tr>-tags
  - DATA QString : puts its information into the <td>-tags
  - HEAD QString : puts its information into the <th>-tags (1)
- QString is a quoted string of characters. The quote marks may be either single or double, but must match. If there are no spaces in the string, the quote marks are optional.
- (1) If there is a HEAD option, the first row read has <th>-tags instead of <td>-tags. It must have a QString of at least "". Succeeding rows have the standard <td>-tags.

httpsplit

Split HTTP Data Stream

- Not implemented in Netrex Pipelines.

iebcopy

Process IEBCOPY Data Format

- Not implemented in Netrex Pipelines.

if

Process Records Conditionally

- Not implemented in Netrex Pipelines.

immcmd

Write the Argument String from Immediate Commands

- Not implemented in Netrex Pipelines.

insert

Insert String in Records

- insert a string into a record before or after the record content. Will be much more efficient than specs especially if the input is a Byte[]

inside

Select Records between Labels

instore

Load the File into a storage Buffer

- Not implemented in Netrex Pipelines.

ip2socka

Build sockaddr\_in Structure

- Not implemented in Netrex Pipelines.

```

- (1) NetRexx only. Inserts the original record number followed by a SPACE at the beginning of each output record.
- (2) NetRexx only. Uses the data from the previous record. Before the first record, this is Rexx "".
- (3) NetRexx Pipelines only. Not yet in CMS Pipelines.
- (4) CMS Pipelines only. Not yet in NetRexx Pipelines.
- (5) NetRexx Only. Uses first record data for first record instead of previous "".
- (6) CMS uses ",", NetRexx does not. CMS limits to right side, NetRexx allows on the left, too; also with any comparison op. NetRexx concatenates the several ranges.

Select Lines that Satisfy Relations using Rexx Parse

- Records are parsed via the `parse_delimited_string`.
- Variables are named `$n`, where `n` is 1 to 9.
- The values of the variables are put into the `logic_delimited_string` replacing `$n` and evaluated. If TRUE, the record is put out on the stream numbered by the `dstring`'s position.
- The stream for a `Dstring` of ELSE is used if no previous `logic Dstring` is TRUE.
- If there is no specific ELSE, there is an implied one at the end; if that stream is not connected, the record is discarded.
- If ONE then the record is put out on, at most, one stream: the first one matched.
- If ALL then the record is put out on all streams matched.
- If SINGLE then the records are all put out on the primary output stream.
- The `parse_delimited_string` and `logic_delimited_string(s)` follow normal NetRexx rules.
- (1) Implied ELSE after last specified `dstring`.
- (2) Up to 10 `logic_Dstrings` may be specified to go to up to 11 output streams (including an implied ELSE).
- Not implemented in CMS Pipelines.

Pickparse permits selecting records by a NetRexx logical expression, using parts of the record selected by a Rexx PARSE template.

A simple example has two delimited strings, a Rexx template and a logical expression:

```
pickparse / . . $3 . 50 $5 +5 / / $3 < $5 /
```

The parse template selects the 3rd word, and the 5 characters starting in column 50. the variable names are a dollar sign and a digit. Then those variables can be used in the logic expression. When run, and records matching the logic expression are written to the primary output stream, others to the secondary. If either stream is not connected, the corresponding records are discarded.

There can be multiple logic expressions, each in its own delimited string. Parenthetical expressions may be used. Records are matched to each in turn. Any records matching are written to that output stream, if connected.

With the option ONE, the default, each record is written to one output stream: the first one it matches. With the option ALL, the matching goes on and a record could be written to multiple output streams.

There is an implicit or explicit ELSE as the last logic expression. Records that have not matched any of the previous expressions match this and are written or discarded depending on if the stream is connected or not.

The parse template can define up to 9 separate zones, \$1 to \$9. The variables `$_n` are also available for the logic expressions; they are the values from the previous record. Initially these are "".

There can be up to 10 output streams defined, and up to 9 logic expressions plus ELSE.

```

- (1) Blanks are optional in this position.
- (2) Blanks are not allowed here.
- (3) CMS only. Not yet implemented in NetRexx Pipelines
- (4) NetRexx Pipelines only. Not yet implemented in CMS
- (5) NetRexx Pipelines only. READ is giving the same output as READSTOP when the streams are different length.
- (6) This senses if it is the first stage, but comment stages will fool it into not producing any output.
- (7) CMS Pipelines, without documenting it, places this right by default NetRexx Pipelines follows the documentation and places this left by default. Specify the alignment you want to override these defaults.
- (8) A *qword* is an optionally quoted word, with single or double marks. If it contains spaces or begins with a quote mark, it must be quoted. It can not start with a space (the quote mark will be considered a single character, and rest gibberish). If is unquoted and an even number of hexadecimal characters, it will be used as a hexchar or hexstring.
- (9) CMS has a mini-programming language built in. It uses Field Identifiers and Control Breaks, Counters, and Structured Data.  
NetRexx does not yet have any of these features.
- (10) The delimited string is any valid NetRexx code. **[Yes, you can get in trouble!]** It is put into a method and executed for each record. The selected input data is in the variable DATA. The returned string is output. The variable array COUNTER[] is available for your use. Unlike CMS, COUNTER is a full NetRexx variable object of type Rexx. Each COUNTER is initially 0, but can hold any NetRexx value, including strings. COUNTERs are persistent for the life of the stage and are shared across all NETREXX converters in a stage. Index can be

number or string. Fields identified by a fieldid are accessed as field["id"] when the quotes are required, the id is a single letter, case is respected.

- (11) The data is processed by the toString() method.
- (12) CMS Only. NetRexx ignores COUNTERS n; it has an unlimited number. See the NETREXX converter(10).
- (13) NetRexx Only. A comma may be used to separate groups for readability. It is ignored by the system.
- (14) Letter is a single character, a-zA-Z. Case is respected. BLANK is not permitted between letter and : . The resulting data is available in the NETREXX code as field["letter"].
- (15) NetRexx Only. A "." for input is "0.0", no data is selected. **data** is "".

Examples:

CMS Pipelines has built into the SPEC stage its own programming language. It is Rexx-like-but-not-quite-Rexx. For NetRexx Pipelines we have built in the worlds best scripting language: NetRexx. This gives all the power, but with a somewhat different syntax, of the CMS version. It is incorporated into the "Conversion" phase, with the key word NETREXX (or NR) and a delimitedString containing the NetRexx source. In running, this code is encapsulated in a method. The data selected in the Input phase is available as the variable **data**. And whatever is returned is passed to the Output phase of the stage. (As a convenience, if the last statement is not RETURN, the statement "return

**Split Long Lines at Word Boundaries**

So all of these pipes work the same (giving cba):

**spill**

**split**

**Split Records Relative to a Target**

```
1-* NR /return data.reverse/ 1 | cons"
• pipe "literal abc | spec 1-* NR @rev = data.reverse; return rev@ 1 | cons"

```

- uses jdbc to select from any jdbc enabled dbms
- properties file (sqlselect.properties default) is read from the secondary input stream to find jdbcdriver name, url, user, pass
- sample properties file:
- ```
#JDBC driver name
#Tue Feb 03 23:29:43 GMT+01:00 1998
jdbcdriver=com.imaginary.sql.mysql.MysqlDriver
url=jdbc:mysql://localhost:1114/TESTDB
# the following are not needed for some DBMS, ex: SQLite
```

`user=db_user_name`  
`pass=password_for_db`

- 
- if this file is not found default (compiled in) values are used
- (1) when using a sql select \* (all columns) from the commandline, quote the query as in  
`java pipes.compiler (query) "sql select * from dept | console"`
- (2) the netrexx/jdbc combination is extremely case sensitive for column and table names
- (3) this sql\_select\_string executed, then statements are read from the primary input stream.  
this is optional in NetRexx Pipelines only.
- (4) CMS does not use the stream input
- (5) NetRexx Pipelines only
- (6) CMS Pipelines is implied HEADERS only.
- (7) A Qword is an optionally quoted word. If it contains spaces, it must be quoted.
- (8) EXPERIMENTAL Subject to change. DBMS is the kind of database, e.g. SQLite. DB\_name is the file name.  
These are used in place of URL and JDBC\_DRIVER. SQLite is the only one tested as of 8/15/20.
- (9) the SQLSELECT stage uses HEADERS as the default.
- (10) USER & PASS are needed for some DBMSs and not others, ex. SQLite.
- (11) the count or other output from non-select statements goes to the secondary output stream if connected, or is discarded. Otherwise it goes to the primary.
- 
- Priority order for URL, JDBC\_DRIVER and DBMS, DB\_NAME (first one found rules):
  1. option in the SQL command string
  2. from secondary input stream
  3. from "sql.properties" file or from file specified by PROPERTIES option
  4. Builtin

*sqlcodes*

**Write the last 11 SQL Codes Received**

- Not implemented in Netrexx Pipelines.

|                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

```

- (1) CMS Pipelines Only.
- (2) NetRexx Pipelines Only.

The options implemented are similar to the CMS definition.

- linger - wait a bit before terminating the last read (units SECONDS)
- timeout - wait this long before timing reads out (units MS)
- deblock - If deblock is omitted a copy stage is used.
- group - similar to CMS. A delimited string containing a stage is expected. You can use a run of stages, but its is dangerous since you to know the stage sep character being used...
- greeting - expect a greeting message and discard it
- nodelay - use the nodelay option
- keepalive - enable keep alive socket option
- onerresponse - synchronize cmds/replys

```

```

- (1) NetRexx Pipelines only.
- (2) CMS Pipelines only.
- Simple tcplisten implementation. You can only supply the port and a timeout value. Its ignored unless tcplisten's output stream has been severed, in which case tcplisten terminates.
- If input stream 0 is connected, tcplisten does a peekto before calling the accept method. The object is consumed after the output of the socket object returns.

- Notes:
- (1) UTF-16 (ASCII) in NJPipes, probably EBCDIC in CMS.
  - (2) In Netrex Pipelines. EBCDIC to ASCII or ASCII to EBCDIC. Maybe in CMS, the documentation is unclear.
  - (3) Not yet in NetRex Pipelines
  - [4] NetRex Pipelines only: The secondary input stream is not yet supported.

*xmsg*

Issue XEDIT Messages

- Not implemented in Netrex Pipelines.

*xpdhi*

Expand Highlighting to Space between Words

- Not implemented in Netrex Pipelines.
